Professional Summary

Backend Software Engineer with ~10 years of experience (Go since 2021) in payments, e-commerce and logistics. At Flip I build bill-payment, partner-integration and cashback services; previously led GCP-to-ByteCloud migrations at ByteDance (up to **82%** cost reduction) and inventory systems at Tokopedia for **1,500+** sellers.

Core Skills

Languages: Go, SQL
Data & Messaging: PostgreSQL, MySQL, Redis, Google Pub/Sub, NSQ
Infrastructure: GCP, Kubernetes, Docker, ArgoCD, GitLab CI, Terraform, Airflow, Grafana, Prometheus
Practices: Payment integrations, reconciliation, monolith migration, TDD, AI-assisted development (Claude Code)

Experience

Flip, Jakarta *Jan 2026 – Present*
Software Engineer (Backend)

- Delivered a new postpaid bill-payment product line end to end (utilities, insurance, telco, internet) across ordering, billing and partner services, with PII masking and input validation; it now serves **hundreds of billers**.
- Built a payment-partner integration service from scratch as sole author (idempotent transactions, status checks, callbacks, catalog sync); migrated legacy traffic with **zero downtime** and grew volume **~6x** in five months.
- Built a rule-based cashback campaign engine with pluggable targeting rules; it powered an A/B test with a **double-digit conversion lift** at a fraction of projected subsidy cost, then rolled out to all users.
- Migrated two high-traffic customer features from a PHP monolith to Go microservices using feature-flagged cutovers and batch backfills; together they serve **millions of requests per month**.
- Strengthened money correctness: automated settlement and reconciliation for a new partner, led an audit that surfaced unapproved partner rewards, and as on-call PIC root-caused below-cost transactions.
- Built an AI-assisted engineering workflow (Claude Code agents with a knowledge base covering **17** services, review gates and internal tooling) and shipped **~400** merged merge requests across **27** repositories in 10 months.

ByteDance, Jakarta *May 2024 – Oct 2025*
Software Engineer (Backend)

- As Service Owner, spearheaded the end-to-end migration of critical warehouse services from GCP to ByteCloud, achieving infrastructure cost reductions of **58.11%** and **82.01%** for key applications.
- Directed assessment, re-architecture and execution of every migration, with **100% successful** cutovers.
- Introduced Hertz clients for warehouse services, laying the groundwork to remove the transit proxy.

Tokopedia / GOTO Logistics (GTL), Jakarta *Jan 2022 – May 2024*
Software Engineer (Backend)

- As Project PIC, led the "Inventory Tracking" project, providing 1,500+ sellers with instant, self-service visibility into non-sellable stock and eliminating the previous 1-day SLA.
- Built inbound data differentiation (DSI) for accurate storage fees, worth a potential **~70 million IDR**/month.
- Raised GIMS data accuracy to **>99.9%** and cut manual effort **80%** by validating Airflow pipelines.

Nusantara Baskara Jaya, Jakarta *Nov 2016 – Dec 2021*
Backend Web Developer

- Built and maintained web applications for Telkomsel clients using Ruby on Rails, Laravel and CodeIgniter.
- Integrated the BNI payment gateway for the "I Loop Run 2019" event.

Education

Alterra Academy – Advancing Career Program, Backend Golang *1 Oct 2021 - 31 Oct 2021*
Bogor Agricultural University (IPB) – Bachelor of Computer Science *Sept 2011 – Feb 2016*
